Summary

Aspiring mechatronics engineer seeking Spring-Summer 2027 Co-ops experienced in robotics, automation, embedded systems, and systems integration. Actively seeking opportunities in autonomous programming, robotics, and manufacturing.

Skills

- AutoCAD
- MATLAB proficiency
- Python
- System Integration
- Robotics programming
- Object-Oriented Programming
- Microcontroller experience (Arduino)
- Sensor Fusion
- Machine and Metal Lab Proficiency
- Software Development

Education

Rochester Institute of Technology

Expected in May 2029

Bachelor of Science: Mechatronics Engineering Technology

Rochester, NY

- Relevant Coursework: Manufacturing Processes, Introduction to Digital and Microcontroller Systems, Machine Tools Lab, Circuits 1, Foundations of Metals, Automation Control Systems, Electronic Devices, Principles of Statics
- GPA: 3.45, Dean's List: Fall 25
- NSBE Fundraising Chair, OAS Vice President

Experience

Rochester Institute of Technology

February 2026 to September 2026

ITS Student Trainee

Rochester, NY

- Executed remote imaging and data backup assistance using BeyondTrust, TCTools and SentinelOne.
- Enhanced work efficiency by 20% through proficiency in desktop imaging and setup.
- Strengthened problem-solving skills by engaging in hands-on challenging assignments including hardware repairs and system troubleshooting.

Council for Scientific and Industrial Research

June 2023 to July 2023

Intern

Accra, Ghana

- Utilized Python-based control systems for robotics prototypes and executed system testing to validate functionality within a 2-week timeline.
- Collaborated with a multidisciplinary engineering team to design, develop, and test robotics and automation prototypes, contributing to full end-to-end delivery.
- Integrated sensors and control algorithms to ensure stable system performance.
- Trained and mentored four young robotics engineers, fostering interest in robotics and programming.

Projects

- **Project Auria** - Developed a solar-powered backpack capable of powering mobile devices. Programmed the charging module and integrated microelectronic components into the system circuitry. Collaborated with a multidisciplinary team of engineers to deliver a functional prototype.
- **Automated Greenhouse System** - Collaborated with a multidisciplinary team to design and develop an Arduino-based autonomous monitoring greenhouse system. The system integrated 5 sensors and three actuators to enable real-time system responses. Control algorithms were implemented to maintain optimal environmental conditions through automated decision-making.
